Executive Summary: Revenue Acceleration Opportunity

Onboarding speed - not acquisition quality - is the primary growth constraint.

Out of 220 registered users, 136 complete their first purchase, resulting in a 61.8% activation rate.

While Outbound leads convert at the highest rate, they also experience the longest activation lag (~49 hours).

This delay temporarily blocks approximately $900 in monthly recurring revenue (~$10.8k annualized).

The core constraint is not acquisition quality, but onboarding speed.

Improving activation velocity in high-conversion channels can accelerate revenue realization without additional marketing spend.

Business Hypothesis	Validated Insight
CAC is too high	CAC payback is delayed due to onboarding lag
Conversion friction is acquisition-driven	Conversion friction occurs during onboarding
Growth is limited by lead volume	Growth is limited by activation speed
Acquisition quality is low	Lead quality is sufficient across channels
Outbound is inefficient	Outbound delivers highest-value users
Marketing underperforms	Revenue realization is slowed post-signup
